

# Predict Future Avocado Prices Using Facebook Prophet

Prepared by Donald Ghazi

## Project Overview

- In this project, I will predict the future prices of avocados using Facebook Prophet.

## What is Facebook Prophet?

- Tool for producing high quality forecasts for time series data that has multiple seasonality with linear or non-linear growth.
- Source: <https://facebook.github.io/prophet/>

## Import Libraries and Dataset

- I first installed fbprophet package as follows: pip install fbprophet
- Source: <https://github.com/facebook/prophet>

```
In [1]: # import libraries
import pandas as pd # Import Pandas for data manipulation using dataframes
import numpy as np # Import Numpy for data statistical analysis
import matplotlib.pyplot as plt # Import matplotlib for data visualisation
import random
import seaborn as sns
from fbprophet import Prophet
```

```
In [2]: # dataframes creation for both training and testing datasets
avocado_df = pd.read_csv('avocado.csv')
```

- Date: The date of the observation
- AveragePrice: the average price of a single avocado
- type: conventional or organic
- year: the year
- Region: the city or region of the observation
- Total Volume: Total number of avocados sold
- 4046: Total number of avocados with PLU 4046 sold
- 4225: Total number of avocados with PLU 4225 sold
- 4770: Total number of avocados with PLU 4770 sold

```
In [3]: # view the head of the training dataset
avocado_df.head()
```

```
Out[3]:
